

Who are we ?

Founded in **1999**, ONSE 7 is an innovation and renovation company that works in construction with the aim of **saving** time and space, effort and cost, while having a concern for the protection of **health**. and the **environment** as well as an aesthetic vision.

Our mission is to design inventions / innovations to contribute to **a greener world**.

All products presented by ONSE 7 are protected by national and international patents (5 products)

Our products have received 14 distinctions including the prestigious medal from the Paris Chamber of Commerce and Industry.

Our products have been presented to the world through numerous articles in specialized and general public magazines.

Invention could slash energy consumption

The innovation, which was tested to light a four-storey building, successfully converted voltage from 220V to 14V, thus, reducing energy consumption by 85 per cent.

ONISE

Context

Like the fire of prehistoric times, electricity has changed the life of mankind. But unfortunately, this same electricity is the source of many domestic incidents: from small electrification, to fire, through serious electrocutions. The use of electricity confronts us with two major issues: user safety and ecology. These two issues are the starting point of the innovation that we are going to present to you.

Our product

The shock-free electricity system eliminates the risk of electrification in homes and drastically reduces energy consumption. It is a simple electronic box connected to the arrival of the current of the residence at the level of the electrical panel. Simple to install, this system allows high voltage alternating current to be transformed into low voltage alternating or direct current, without causing any loss of intensity and without the need to increase the section of the wiring used, and over long distances

Product benefits

Security

Product that eliminates any risk of electrocution or fire.

Economy

Allows a saving of 80% on the concerned lighting.

Ecology

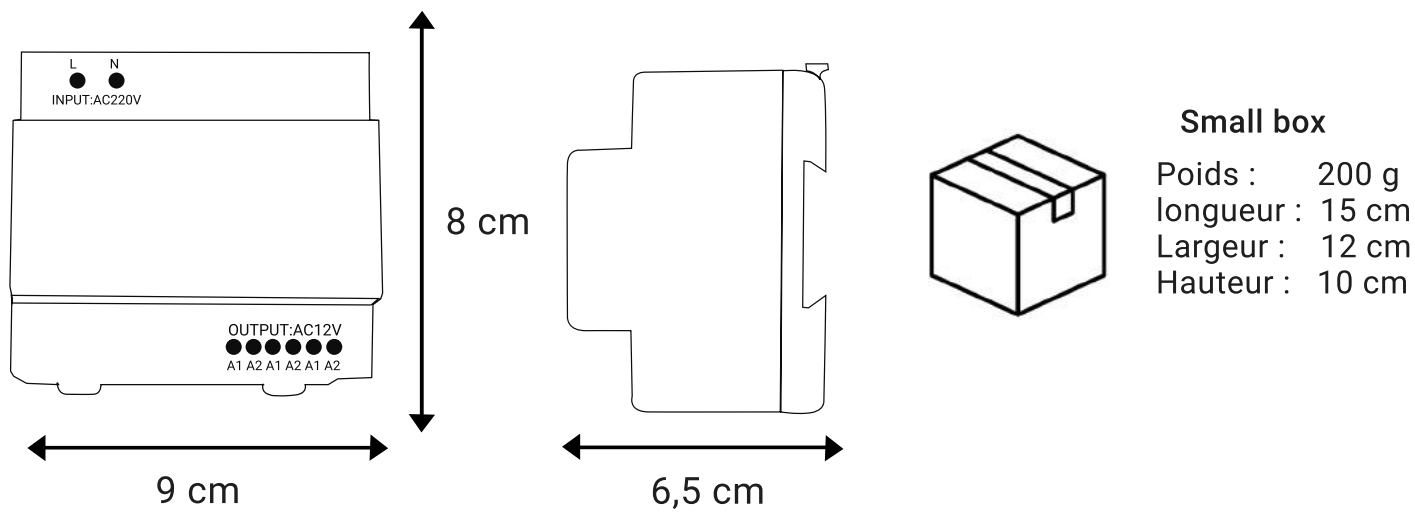

Allows to use a 12v circulation on low consumption lamps. These lamps are generally powered in 240V.

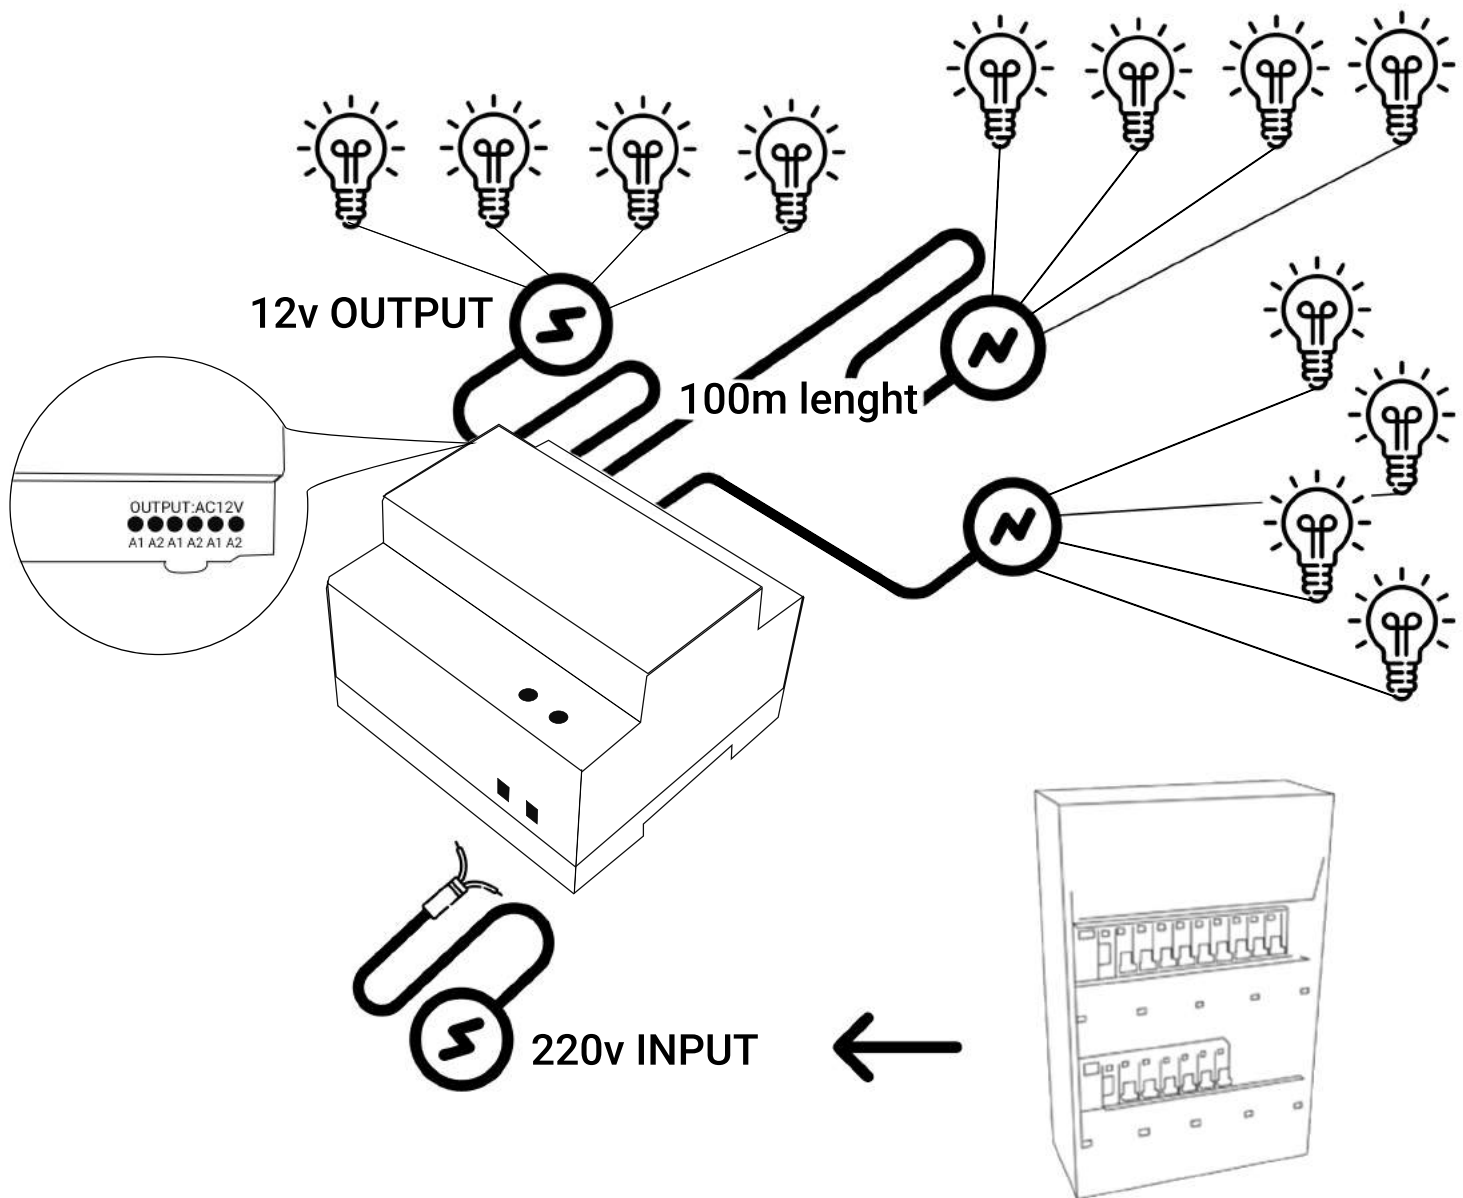

Easy to install

The product is easily installed near an electrical panel.

Product information

Product function

Production capacity

All necessary procedures have been developed with full-scale production in mind,

the system are produced in a factory located in Egypt but will soon be produced in Europe

The products are stored in Villeneuve L'Archevêque (1h30 from Paris) on a surface of more than 1000m², with a view to distribution throughout the national territory.
